

Meta App Review — Screencast Narration

Orion Agency · Voice-over / subtitle script. One block per scene, mapped to the requested permissions. Read at a calm pace; pause between scenes so each action completes.

App scopes (`src/lib/meta-facebook-provider.ts`):
`public_profile`, `ads_read`, `ads_management`, `business_management`, `pages_show_list`, `pages_read_engagement`

Scene 1 — Facebook Login & consent

`public_profile`

On screen: Open the login page → click "Continue with Facebook" → show the Facebook OAuth dialog listing the requested permissions → accept → return signed in (name/photo in the header).

This is **Orion Agency**, a media-buying tool that helps marketing agencies manage their clients' Meta ad accounts. To get started, the user connects their Meta account through Facebook Login. We use `public_profile` only to identify the signed-in user — the name and profile picture shown here in the header. No personal data is shared with third parties.

Scene 2 — Connect Business Manager & ad accounts

`business_management` · `pages_show_list`

On screen: Clients → New client → Step 1 name → Step 2 pick a Business Manager (loaded from Meta) → Step 3 pick ad accounts (with last-30-days spend) → finish. Then open Client → Settings and show the Facebook Pages loaded from Meta under "publishing assets".

When adding a client, the app lists the Business Managers and ad accounts the user has access to, using `business_management`. This lets the agency organize each client under the correct Business Manager and ad accounts. Then, with `pages_show_list`, we load the user's Facebook Pages so they can choose which Page will publish this client's ads.

Scene 3 — Reading metrics and insights

`ads_read`

On screen: Show 2–3 with real data — Dashboard KPIs and performance chart; Campaigns table → open a campaign → ad sets → ads → creatives; Creatives ranking → open a creative's details; Reports → preview a performance report with KPIs and audience breakdown.

All performance data is read with `ads_read`. The app syncs metrics for campaigns, ad sets, ads, and creatives from the connected accounts and presents them in dashboards, creative rankings, and performance reports. This is read-only access, so the agency can monitor each client's results.

Scene 4 — Managing and publishing campaigns

`ads_management`

On screen: On an existing campaign, toggle status to pause and reactivate; open "Edit budget" and change the daily budget (show success). Then Campaigns → New campaign → walk the guided wizard: **Objective** → **Campaign** → **Ad set** → **Ad** → **Review** → click **Publish** → show the new campaign created in the ad account.

With `ads_management`, the user creates and manages campaigns directly from the app. A guided wizard builds the campaign, ad set, and ad — choosing the objective, budget, audience targeting, placements, the publishing Page, the creative and the destination — and publishes it to the client's Meta ad account. The user also performs everyday management actions — pausing and reactivating campaigns and adjusting budgets — which are applied immediately to the account.

Scene 5 — Custom and engagement audiences

`ads_management` · `pages_read_engagement`

On screen: Audiences → select client and ad account → show the audience list synced from Meta → open an audience's details. Then create an audience in the guided wizard: an **Engagement** audience (Facebook Page / Instagram), a **Lookalike**, or a **Saved** audience → show the new audience in the list.

For audiences, `ads_management` lets the user create custom audiences, lookalikes, and saved audiences in the clients' ad accounts. When an audience is based on engagement with the client's Page or Instagram, we use `pages_read_engagement` to identify who interacted and build the corresponding audience.

Scene 6 — Closing (optional)

On screen: Return to the dashboard showing the full picture — connected client, campaigns, and the generated report.

To sum up: **Orion Agency** is a media-buying tool for agencies. It connects the clients’ Meta accounts, reads campaign performance with `ads_read`, and creates and manages campaigns and audiences with `ads_management`, all organized by Business Manager (`business_management`) and Page (`pages_show_list` and `pages_read_engagement`).

Permission → use-case summary

App Review form

Permission	Justification
<code>public_profile</code>	Identify the signed-in user (name/photo) after Facebook Login.
<code>business_management</code>	List the user’s Business Managers and ad accounts to organize each agency client under the correct Business Manager and accounts.
<code>ads_read</code>	Read campaign, ad set, ad, and creative metrics/insights for dashboards, creative rankings, and performance reports.
<code>ads_management</code>	Create and manage campaigns (create/publish, pause/reactivate, adjust budgets) and create audiences (custom/lookalike/saved) in the clients’ ad accounts.
<code>pages_show_list</code>	List the user’s Pages so they can select the Page used to publish each client’s ads.
<code>pages_read_engagement</code>	Build custom audiences from engagement with the client’s Page/Instagram.

Recording checklist

- ☐ Signed in with the app’s **test user** (not a production personal account).
- ☐ Every permission shown with a **concrete action** (not just the consent screen).
- ☐ Facebook OAuth dialog visible with the listed permissions.
- ☐ Screens show **real data** (campaigns, spend, audiences) — nothing empty.
- ☐ At least one **write action** completed (publish a campaign + create an audience).
- ☐ Continuous footage, readable resolution (≥ 720p).
- ☐ English narration or subtitles.
- ☐ Suggested length: 3–6 minutes.

Note: the requested scopes do not include messaging (WhatsApp/Messenger API). The app builds click-to-WhatsApp ads via `ads_management` only — avoid emphasizing messaging in the narration.
